How we work on Bullpen together

Two founders, two PCs, one GitHub repo. Each of us has a full copy of the project on our own computer. GitHub is the shared copy everyone syncs through. These rules keep the two copies from stepping on each other.

The one rule

Nobody works directly on `main`. `main` is the version that works. Every change happens on its own branch, then gets merged into `main` after the other founder has looked at it.

One-time setup

1. Both of us make a GitHub account (free).
2. The repo owner creates a **private** repo called `bullpen` and adds the other founder: repo page → Settings → Collaborators → Add people.
3. Turn on branch protection: Settings → Branches → Add rule for `main` → tick "Require a pull request before merging". This makes the one rule automatic.
4. Each of us copies the repo to our PC once ("clone"). Easiest ways:
   - In Claude Code, say: "Clone github.com/OWNER/bullpen into my Desktop folder."
   - Or install GitHub Desktop and use File → Clone repository.
5. Open the folder in Claude Code. It reads `CLAUDE.md` automatically, so Claude starts with the full project context.

The daily loop

Every task, big or small, goes through the same six steps. You can ask Claude Code to do each one in plain words.

1. **Get the latest.** Switch to `main` and pull. ("Switch to main and pull the latest.")
2. **Make a branch for the task.** Name it after the task, e.g. `lesson/index-funds` or `fix/hearts-reset`. ("Make a new branch called lesson/index-funds.")
3. **Work and commit in small steps.** One commit per finished piece, with a message that says what changed. ("Commit this with a clear message.")
4. **Push the branch to GitHub.** ("Push this branch.")
5. **Open a pull request (PR)** on GitHub from your branch into `main`. Write 2-3 lines on what it does and how to check it.
6. **The other founder reviews and merges.** They look at the changes, try the prototype, comment or approve, then press "Merge". Delete the branch afterwards.

Keeping it from getting messy

- **Say what you're working on before you start.** A quick message ("I'm on the Index funds lesson") stops two people editing the same thing.
- **Split by area.** Example: one founder owns lesson content, the other owns the trading and league screens. Swap when you like, just say so.
- **Watch the single-file prototype.** Right now almost everything lives in `prototype/index.html`. Two people editing it at the same time is the most likely source of conflicts, so take turns on it until the real app is split into many files.
- **Keep branches short.** Merge within a day or two. Long-running branches drift away from `main` and get painful to merge.

- **Pull `main` into your branch if it has moved** while you were working. ("Bring the latest main into my branch.")
- **Never force-push and never rewrite `main`.**
- **Secrets never go in the repo.** API keys and passwords live in a `.env` file, which is already ignored by Git.

When Git says there's a conflict

A conflict means both of us changed the same lines. Nothing is lost. Ask Claude Code: "There's a merge conflict, show me both versions and help me pick." Keep the right lines, test the prototype, commit. If unsure, ask the other founder before choosing.

Already set up in the repo

- `.gitattributes` keeps line endings consistent between Windows, Mac and Linux, and marks PDFs and images as binary so Git never corrupts them.
- `.gitignore` keeps junk files and secrets out.
- `CLAUDE.md` holds the project brief, settled decisions and rules. When we decide something new, we add it there in the same PR, so both of our Claudes always know it.

Content rules (short version)

- Lesson text is always our own words. We link to Investopedia for "go deeper" reading but never copy its text.
- Check every number and every right answer.
- Nothing in the app tells a user to buy, sell or hold a real asset.
